

most rainwear promises are full of hot air...

It's true. And that's because most waterproof jackets use fabrics (including the "leading" fabric brand) that do not allow moisture vapour to pass through freely — commonly referred to as "breathing". They have a thin layer of polyurethane (PU) which blocks the path for direct venting — they simply cannot "breathe" easily. Consequently, moisture vapour condenses on the inside of the fabric and you end up wet from your own sweat ...sound familiar?

While eVent® has all the waterproof performance you'd expect from a PTFE membrane, the absence of a PU coating allows uninhibited breathability — eVent® is the market leader in letting the sweat out.*

Macpac is committed to making products that live up to expectations. When we first trialled eVent® in our iconic *Prophet* and *Resolution* jackets we knew that we should abandon old ways and offer our customers the most breathable waterproof fabric we had ever seen.

Macpac is proud to be the first Australasian company to produce eVent® rainwear, a partnership that you can trust to deliver on all its promises.
